

→ Assumptions in ANOVA

1. Normality of sample distribution of mean.

The distribution of sample mean is normally distributed.

2. Absence of Outliers

Outliers need to be removed from the dataset.

3. Homogeneity of Variance

Population variance is different levels of each independent variable are equal.

$$[\sigma_1^2 = \sigma_2^2 = \sigma_3^2]$$

4. Samples are independent and random.
