

K Means Vs Hierarchical Clustering.

Scalability and flexibility.

i. Data size $\rightarrow$ Huge $\rightarrow$ K Means

Small $\rightarrow$ Hierarchical Clustering.

ii. K Means $\rightarrow$ Numerical data.

Hierarchical Clustering $\rightarrow$ variety of data 

iii. Centroids $\rightarrow$ K Means $\rightarrow$ ~~the~~ of Elbow method $\rightarrow$ No. of centroids

$\rightarrow$ Hierarchical Clustering $\rightarrow$ No. of clusters

Note: i. If only the numerical data ~~and~~ we use K Means and also for huge data set.

ii. If the data is not huge and it contains variety of data then use Hierarchical Clustering.
